

4 March 2002 Staff Workshop

Total Maximum Daily Loads  
for the San Joaquin River:  
Organophosphorus Pesticides  
& Salt and Boron

CVRWQCB

San Joaquin River TMDL Unit

# Workshop Agenda

- Morning Session:  
Organophosphorus Pesticide TMDL
- Afternoon Session: Salt and Boron TMDL
  - Welcome and Introductions
  - Overview of Regional Board's TMDL Development Process and Timelines
  - Salt and Boron TMDL
    - Staff presentation
    - Questions and discussion

# What Is a TMDL and Why Do One?

- TMDL = Total Maximum Daily Load
- TMDLs are required under section 303(d) of the Federal Clean Water Act
  - TMDLs must be developed for pollutants and waterbodies that have been identified on 303(d) list of impaired waterbodies

# What Is a TMDL and Why Do One?

- TMDL = Total Maximum Daily Load
- TMDLs are required under section 303(d) of the Federal Clean Water Act
  - TMDLs must be developed for pollutants and waterbodies that have been identified on 303(d) list of impaired waterbodies

# What Is a TMDL?

- A total maximum daily load (TMDL) is the amount of a specific pollutant that a waterbody can receive and still maintain a water quality standard
- TMDLs allocate pollutant loads to point and nonpoint sources...

# What Is a TMDL?

- $\text{TMDL} = \text{WLA} + \text{LA} + \text{MOS} + \text{background}$

WLA: waste load allocation for point sources

LA: load allocations for nonpoint sources

MOS: margin of safety

# Components of TMDLs

- TMDL Description (Problem Statement)
- Numeric Targets (will often be new water quality objectives)
- Source Analysis
- Allocations
- Linkage Analysis (relationship between sources, allocations, and targets)
- TMDL Report
- *Implementation Plan*

Region 5

San Joaquin River Basin

# Lower San Joaquin River Basin

# TMDL Timeline

## Current Activities

| Watershed         | June 2001                | June 2002               | June 2003                                              |

# San Joaquin River Salt and Boron TMDL Progress Update

Les Grober

Eric Oppenheimer

San Joaquin River TMDL Unit

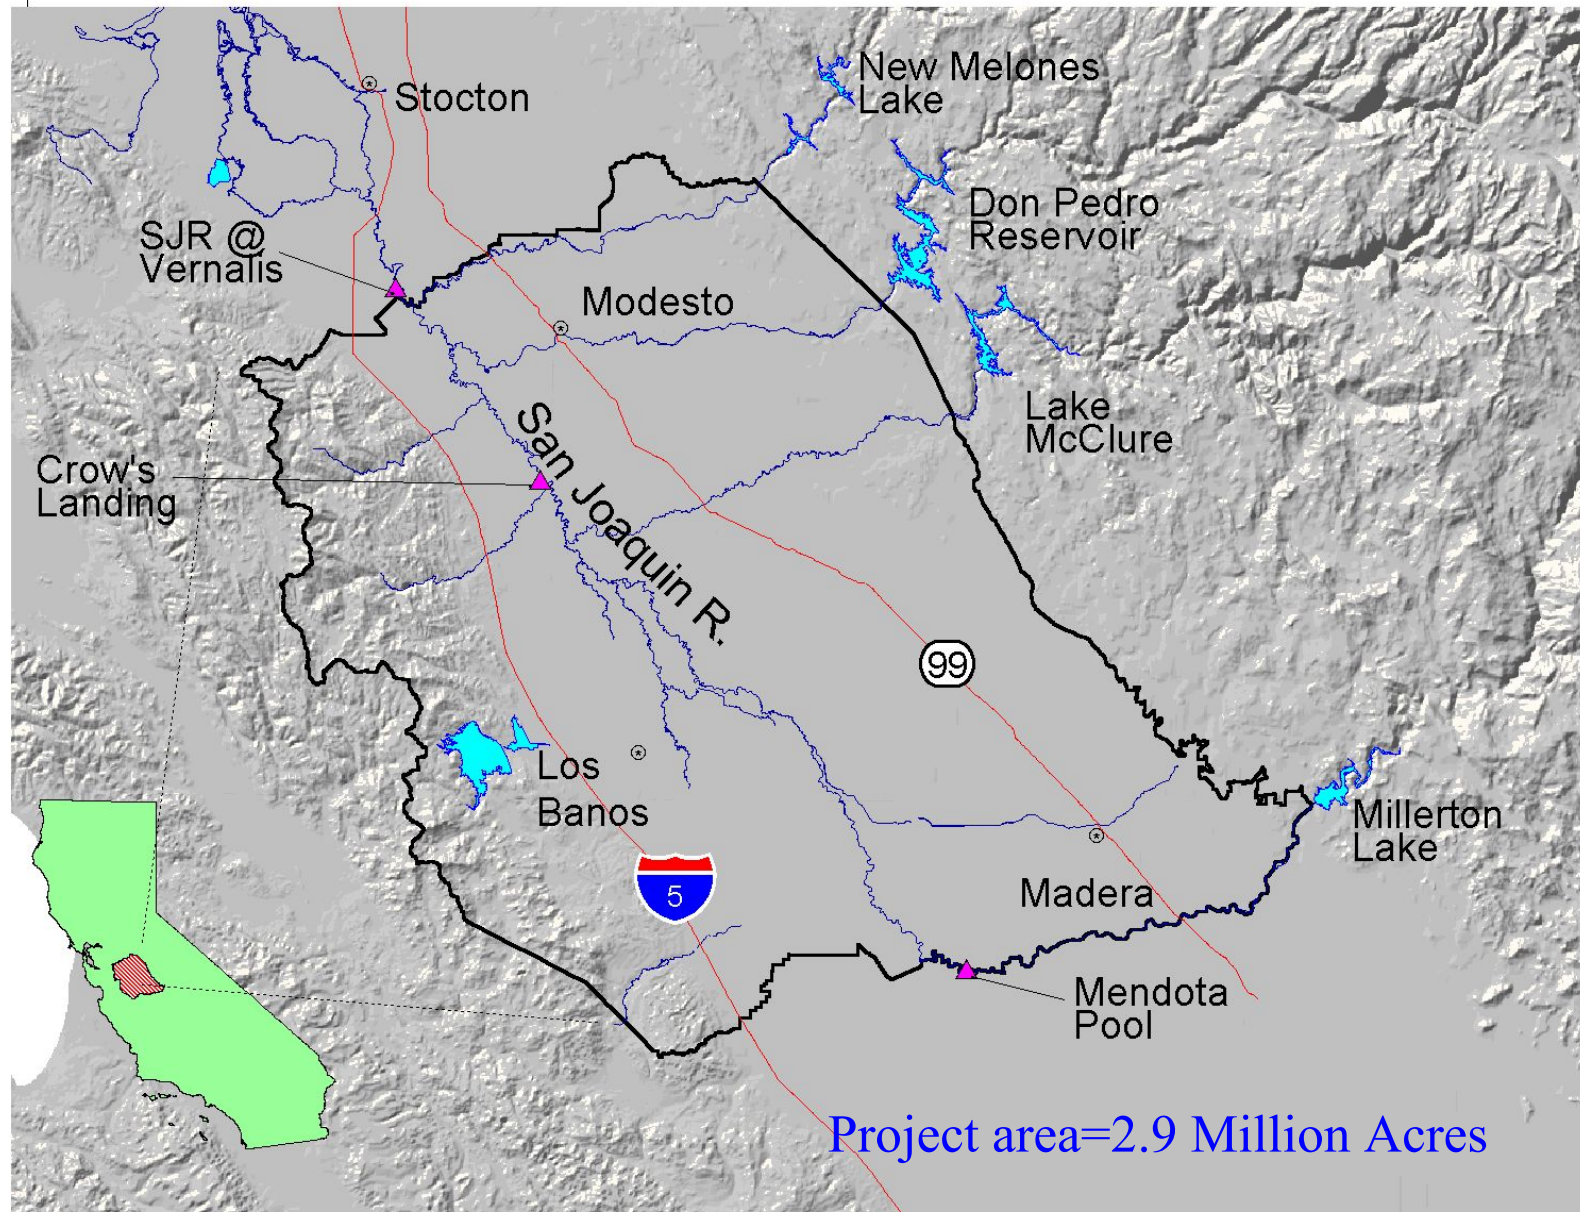

# Topics to be Covered

- Background Information
- Source Analysis
- Loading Capacity and Allocations
- Next Steps

# Background

- Phased Approach:
  - TMDL limits calculated to meet only Vernalis water quality objectives
- TMDL Report completed
  - Sent to USEPA January 2002
  - Technical work product only
  - No legal standing until incorporated into Basin Plan

# Project Area for Salinity and Boron TMDL

# San Joaquin River near Vernalis

## 30 Day Running Average Electrical Conductivity

# Salinity and Boron Numeric Targets at Vernalis

|          | Irrigation Season<br>April to August | Non-Irrigation Season<br>September to March |
|----------|--------------------------------------|---------------------------------------------|
| Salinity | 700 $\mu\text{S}/\text{cm}$          | 1000 $\mu\text{S}/\text{cm}$                |
| Boron    | 0.8 mg/L                             | 1.0 mg/L                                    |

# TMDL Source Analysis

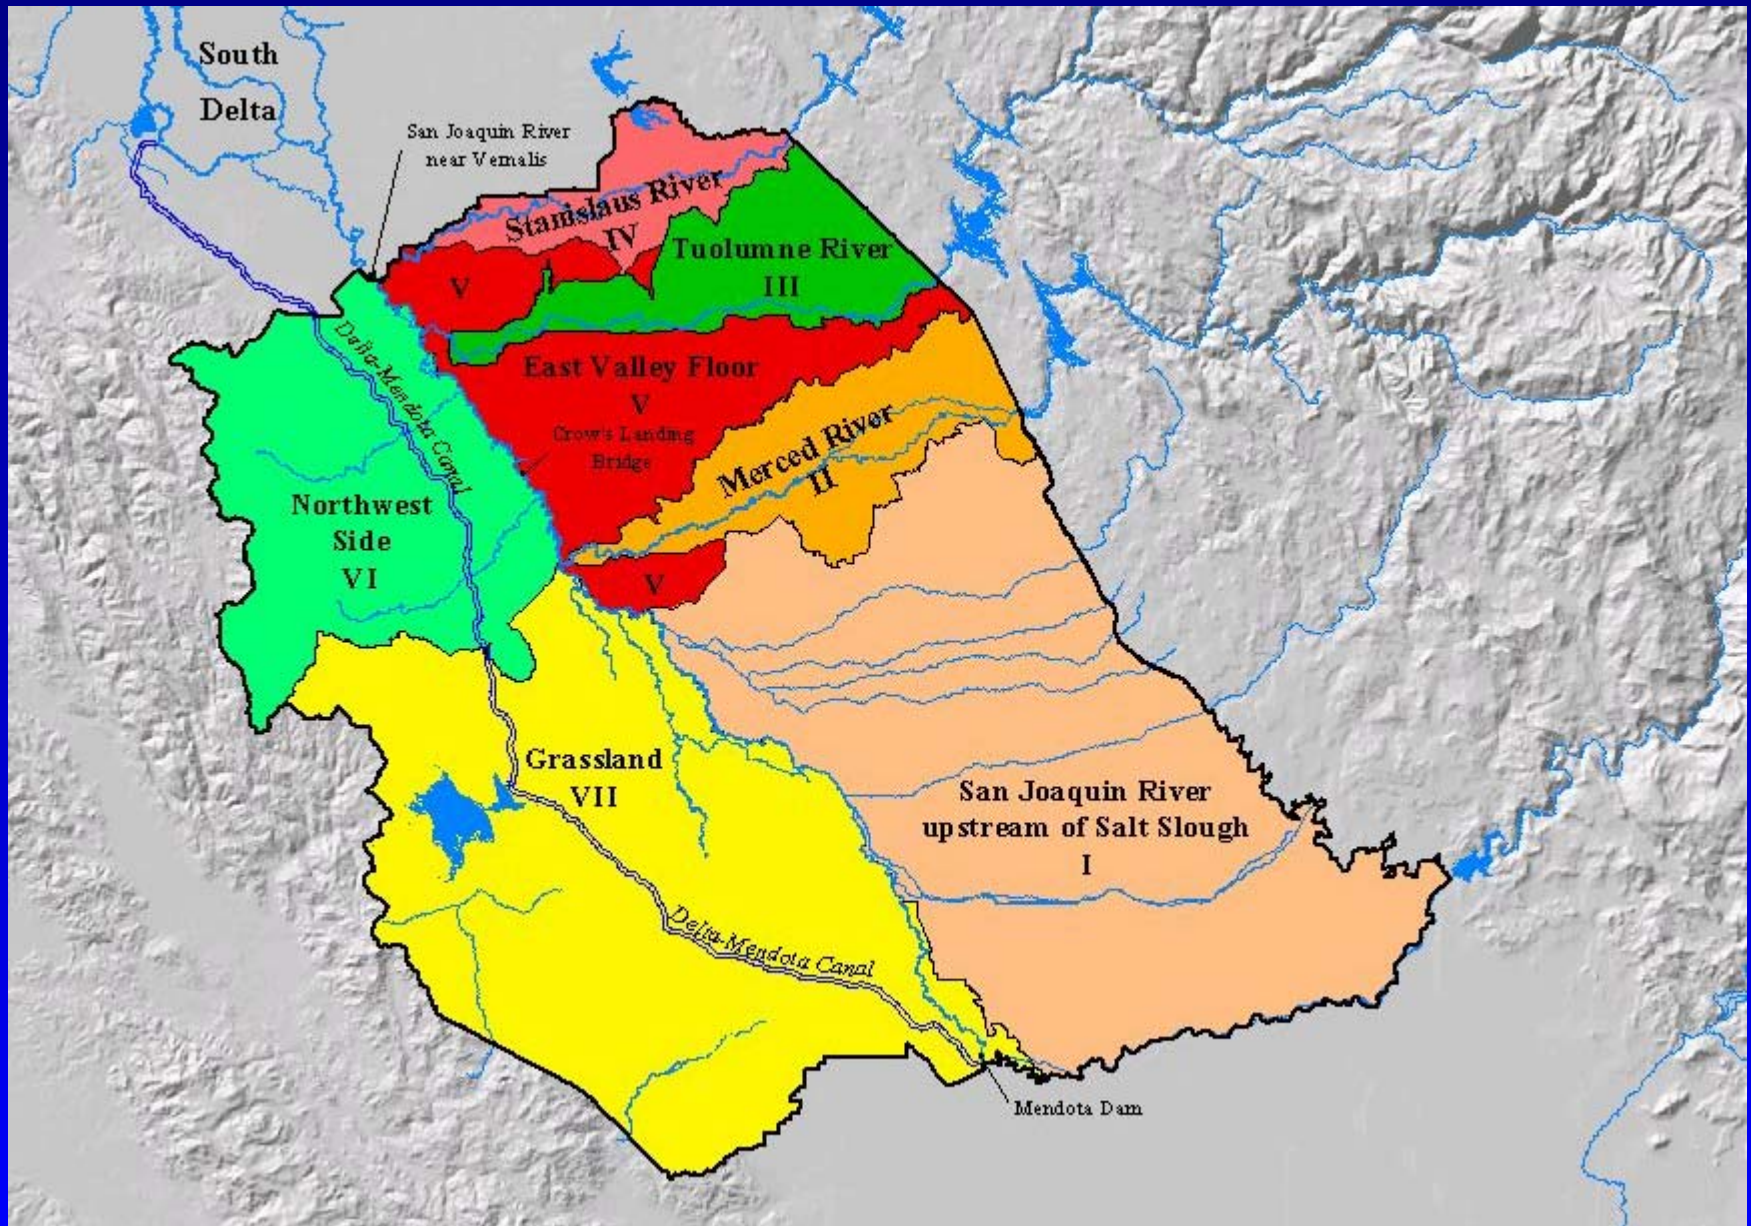

## Objective:

- Determine the quantity and location of salt and boron loading in the watershed
- Ensure that all significant sources will be addressed so that load allocations result in attainment of Numeric Targets

## Approach:

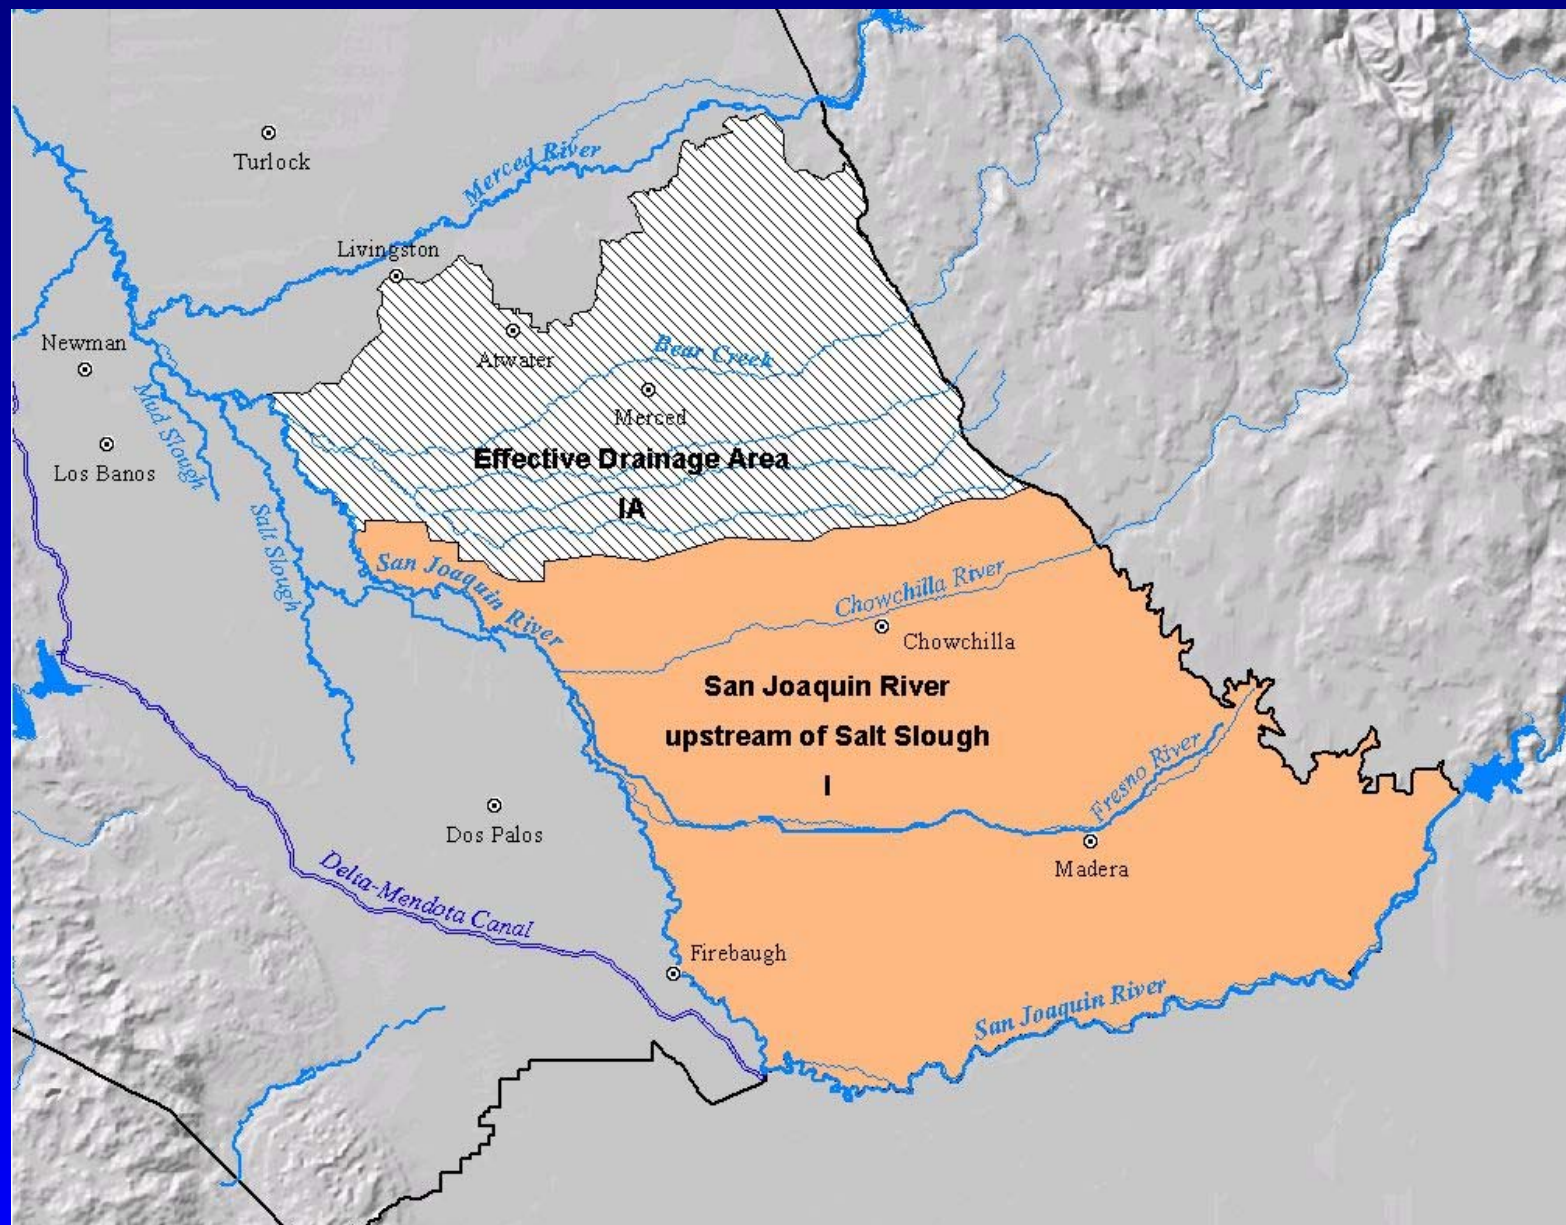

- Divide the watershed into geographic sub-areas
- Use monitoring data and modeling to determine loading from sub-areas and source types.

# Lower San Joaquin River Basin Sub-areas

# Modification to The LSJR above Salt Slough

# Sources of Salt (by sub-area)

Mean Annual Salt Load to SJR for WY 1977 to 1997: 1.1 million tons

\*Northwest Side estimated by difference : Vernalis minus sum of other sources

\*\* East Valley Floor extrapolated from TID 5 data (1985-1996)

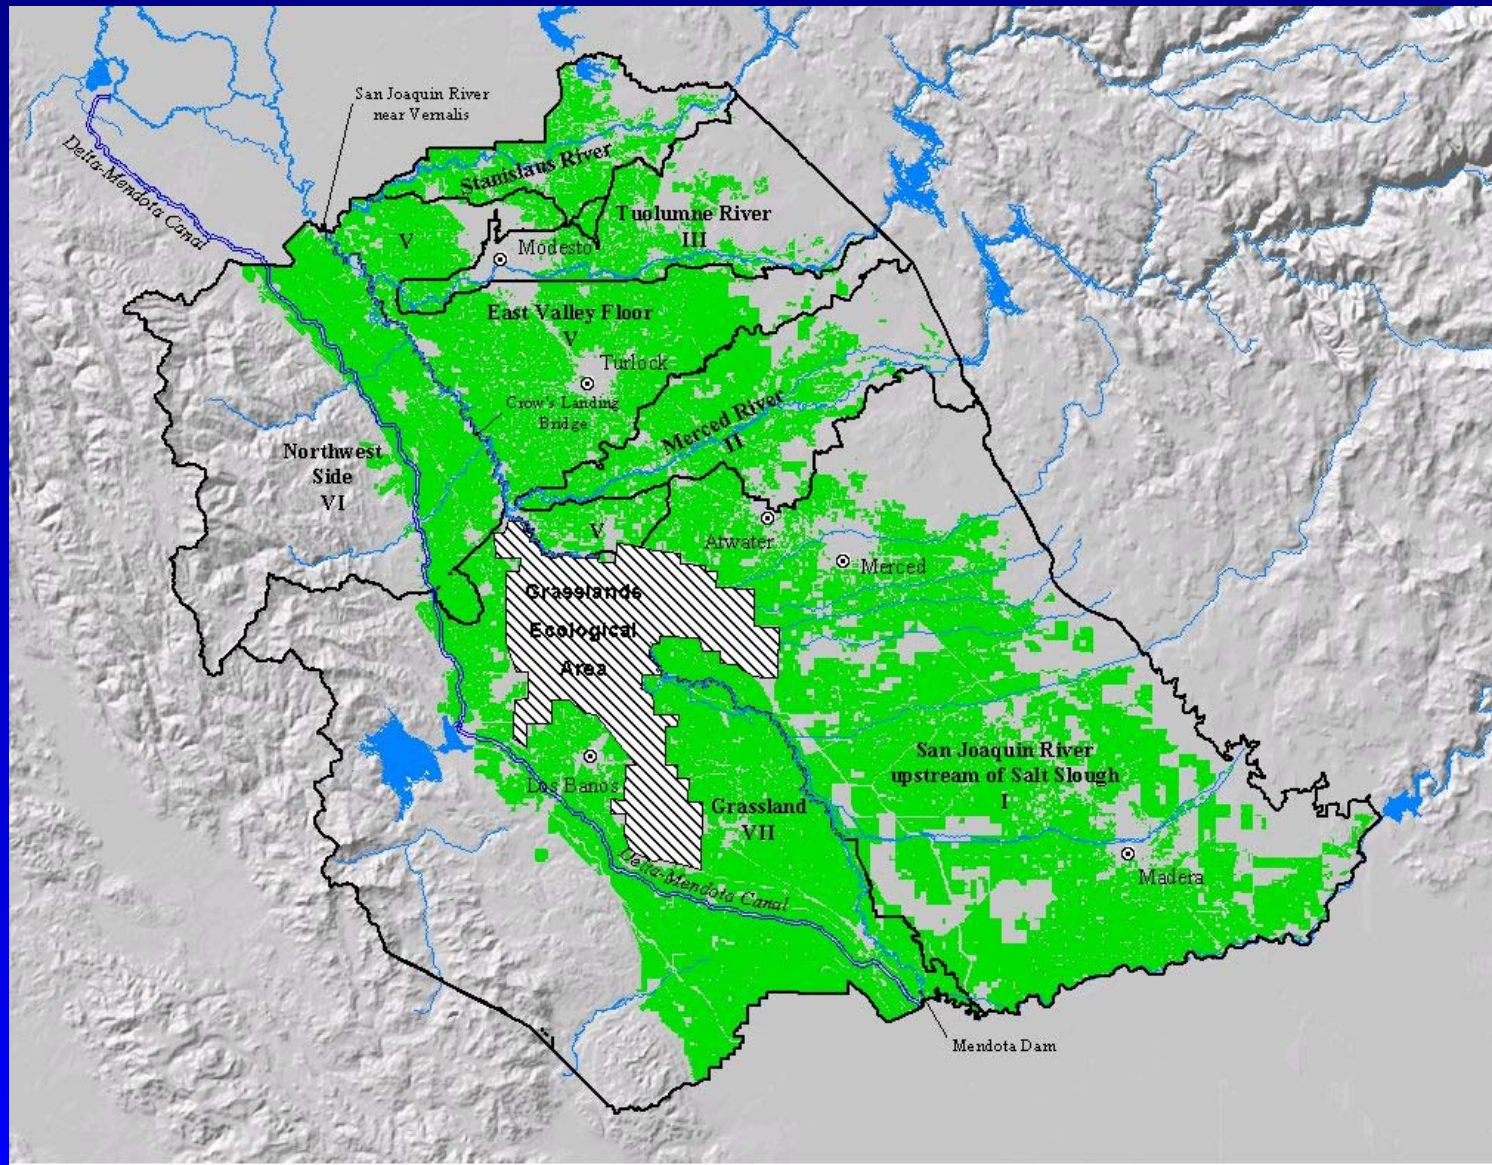

# Sources of Salt (by source type)\*

\* Sum of the sources exceed 100 percent because different methods were used to calculated loads form various sources - not a mass balance

# Land Use in the Lower San Joaquin River Basin

# Lower San Joaquin River Basin NPS Land Uses

| Sub-area               | Agriculture | Managed Wetlands | Total |
|------------------------|-------------|------------------|-------|
| SJR above Salt Slough* | 149         | 34               | 183   |
| Grasslands             | 331         | 100              | 431   |
| North West Side        | 119         | --               | 119   |
| East Valley Floor      | 216         | --               | 216   |
| Merced River           | 94          | --               | 94    |
| Tuolumne River         | 52          | --               | 52    |
| Stanislaus River       | 53          | --               | 53    |

in 1000 acres

\* Based on effective drainage area

# Non Point Source Loading (Per Acre by Sub-area)

| SUB-AREA                 | NPS<br>(1000 acres) | NPS* Loads<br>(1000 tons/year) | NPS Load<br>(tons/acre/year) |
|--------------------------|---------------------|--------------------------------|------------------------------|
| SJR above Salt Slough    | 183                 | 22                             | 0.12                         |
| Grasslands               | 431                 | 400                            | 0.93                         |
| <b>North West Side**</b> | <b>119</b>          | <b>182</b>                     | <b>1.53</b>                  |
| East Valley Floor        | 216                 | 49                             | 0.23                         |
| Merced River             | 94                  | 14                             | 0.15                         |
| Tuolumne River           | 52                  | 30                             | 0.58                         |
| Stanislaus River         | 53                  | 14                             | 0.27                         |

\*NPS Load = total sub area load – background load – M&I Load

\*(NPS load includes groundwater loads)

\*\*Deep groundwater salt contribution subtracted from North West Side

# Non Point Source Loading (Per Acre by Sub-area)

# TDS Imported and Discharged from the West Side\* of the LSJR

\*West Side= Grasslands+NW Side  
sub-areas

Water Year

# TMDL Loading Capacity

## Objective:

- Determine the maximum amount of salt and boron loading that occur while meeting the water quality objectives at Vernalis

# TMDL Loading Capacity

## Developing Design Flows:

- Construct a long-term historic flow record superimposing the current level of water development on past flow regimes

## Developing Design Flows:

A 73-year record of flows at Vernalis was compiled from DWRSim model output from CalFed study 771

### CalFed study 771 description and modifications

- Best available representation of current LSJR conditions
- Vernalis Adaptive Management Plan (VAMP) flows are included
- Includes releases for water Quality that were mandated by SWRCB Decision 1641

# TMDL Loading Capacity

## Developing Monthly Design Flows:

- Sort flows by month and water-year type

**12 months \* 5 water year types =**

**60 month/water year type groupings**

# TMDL Loading Capacity

## Developing design Loads:

- Identify the critical low flow for each month water-year type grouping
- $\text{TMMML (Loading Capacity)} = \text{WQ objective} * \text{design Flow}$

**Results in TMMMLs for 60 month/water year type groupings**

# Vernalis Adaptive Management Plan (VAMP) Pulse Flow Considerations

|                           | Percent of May           |                    |                    |
|                           | 48%                      |                    |                    |

**13 time periods \* 5 water year types =**

**65 month/water year type groupings**

## Determining Available Loads:

The TMML must consider ambient loading and a Margin of Safety

$$\text{TMML} = \Sigma \text{LA} + \Sigma \text{WLA} + \text{BG loads} + \text{GW Loads} + \text{MOS}$$

Load Allocations are dependant on background loads and groundwater loads

$$\Sigma \text{LA} + \Sigma \text{WLA} = \text{TMML} - (\text{BG loads} + \text{GW Loads} + \text{MOS})$$

# Consumptive Use Allowance

Allows unrestricted discharge of water below a determined “trigger value”

- Provides a base salt load allocation that considers evapoconcentration of salts
- Provides an opportunity to discharge relatively high quality water that would otherwise be limited by static load allocations

# Consumptive Use Allowance

- The Trigger Value is based on a discharge water quality from a non-point source that receives an excellent quality supply water (52 mg / L TDS)
- Trigger Value assumes a 73 percent Seasonal Application Efficiency
- Based on these two factors the trigger value has initially been set at 193 mg/L TDS

# Consumptive Use Allowance

$$\textit{Trigger Value} = \frac{C_{BG}}{(1 - SAE)}$$

Where:

$C_{BG}$  = 52 mg/L (background concentration of supply quality)

SAE = 0.73 (seasonal application efficiency)

$$\textit{Trigger Value} = 193 \text{ mg} / \text{L}$$

Actual Consumptive use allowance (load)  
will depend on discharge flow volume

# Determining Available Loading Capacity:

The TMML must be updated to consider the additional loading from the consumptive use allowance:

$$\text{TMML} = \Sigma \text{LA} + \Sigma \text{WLA} + \text{BG loads} + \text{GW Loads} + \text{MOS} + \text{CUA}$$

Load Allocations are dependant on background loads, groundwater loads, and **the consumptive use allowance:**

$$\Sigma \text{LA} + \Sigma \text{WLA} = \text{TMML} - (\text{BG loads} + \text{GW Loads} + \text{MOS} + \text{CUA})$$

# Base Salt Load Allocations (pounds of salt per acre)

| Year-type | Month / Period |     |     |           |                      |             |     |     |     |     |     |     |     |
|-----------|----------------|-----|-----|-----------|----------------------|-------------|-----|-----|-----|-----|-----|-----|-----|

Table 4-14 in  
TMDL report

# Historical Salt Loading compared to TMML

# Historical Salt Loading compared to TMML

# Historical Salt Loading compared to Allocatable load

# LSJR Above Salt Slough Sub-area Base Load Allocations

# Load Allocations and Waste Load Allocations

# Waste Load Allocations for Point Sources

- Waste loads from point sources make up a relatively small percent of the total SJR loading (2%)
- Waste load allocations for the first phase of this TMDL have been set equal to historical loading (except when there is no assimilative capacity)
- Waste load allocations will be revised as part of the basin planning process

# Waste Load Allocations

Table 4-7 in TMDL Report (waste load allocations in thousand tons)

| All year types                                                              | Jan | Feb | Mar | Apr* | May* | Jun** | Jul | Aug*** | Sep | Oct | Nov | Dec |

# Load Allocations

## Objective:

- The objective is to identify and use a method that will fairly allocate the available loading capacity between various sources throughout the basin

# Approach

- The approach taken starts with an evenly distributed base load allocation upon which various additional load allocations are provided to account for several important considerations

# Considerations

- Phased Approach
- Central Valley Project Impacts
- Need for Salt Balance

# Phased Approach

- Required when a TMDL involves both point and nonpoint sources and the point source waste load allocation is based on a load allocation for which nonpoint source controls need to be implemented
- Preferable because it allows for revision of waste load allocations and load allocations in response to changing hydrologic conditions and availability of additional data and new water quality objectives

# Central Valley Project Impacts

- Decreased SJR flows resulting from the diversion of SJR water at Friant Dam to agricultural areas outside of the SJR Basin
- Increased salt load imports to the basin associated with the replacement of SJR water with imports from the Sacramento and San Joaquin River Delta

# Central Valley Project Impacts

## TMDL Implications

- Responsibility for meeting TMDL load limits must extend beyond usual point and non-point source discharges
- Load limits and allocations must be considered for other responsible parties
- SWRCB in Water Right Decision 1641, recognized that the United States Bureau of Reclamation's actions have reduced water quality of the SJR at Vernalis

# Central Valley Project Impacts

## SWRCB D-1641

- The SWRCB Order in Decision 1641, adopted 29 December 1999, amended the CVP permits under which the USBR delivers water to the San Joaquin Basin to require that the USBR meet the 1995 Bay Delta Plan Salinity objectives at Vernalis
- The USBR has wide latitude in developing a program to achieve this result

# Need for Salt Balance

- Salt and boron are naturally occurring elements that are mobilized whenever water is applied to soils (precipitation and applied irrigation water)
- Concentrations of salt and boron also increase as a result of evapotranspiration
- Historically, more salt has been imported to basin than has been exported

# Need for Salt Balance TMDL Implementation

- Typically, fixed TMDL load limits are established to meet water quality objectives during low flow conditions
- Recognizing need to maintain a salt balance in the basin, there is a need in salt and boron TMDL to maximize salt exports while still meeting water quality objectives

# Special Considerations

## Conclusions

- TMDL load limits must be established that recognizes changing conditions in basin:
- Allowance must be made for dischargers that receive impaired water
- Load limits must be established for entities that are responsible for salt imports
- Relaxation in load limits is needed to take advantage of periods with assimilative capacity greater than those afforded by low flow conditions

# Challenge:

How can these special considerations  
be incorporated in the TMDL?

# Load Allocation Methodology

- Base Load Allocation Method
- Import Water Relaxation
- CVP Load Allocation
- Real-time Relaxation

# Base Load Allocation

- Use expected low flow (worst-case) conditions
- Background loads are subtracted from total loading capacity
  - Sierra Nevada supply water
  - Groundwater
- Consumptive use allowance loads subtracted from total loading capacity
- Waste load allocation assigned to point sources initially set at current loading rates
- Remaining assimilative capacity is evenly distributed to non-point sources in entire basin
- Emphasis on method, rather than fixed numbers

# Base Salt Load Allocations

Base Salt Load Allocations in pounds of salt per acre\* (table 4-14 in TMDL report)

| Year-type                                                                                              | Month / Period |     |     |           |                     |            |     |     |     |     |     |     |     |

# Import Water Relaxation (Central Valley Project Imports)

- Sub-areas with impaired (high salt) water supply receive additional load allocation
- This “import water relaxation” is set at 50 percent of mean salt load imported to the sub-area by the Delta Mendota Canal (DMC) during low flow conditions
  - Assumption: 30 percent return flow with some added salt to account for evapo-concentration and leaching of salt from prior years
- Problem: additional load allocation results in violation of water quality objectives

# DMC Import Water Relaxation

# Import Water and SJR Diversion Relaxation

- Problem: addition of these salt load allocations will result in violation of water quality objectives
- Solution: impose load limits on supply water

# CVP Load Allocation

- The USBR is responsible for salt load in Central Valley Project (CVP) water delivered to the TMDL project area that is in excess of a base load for equivalent volume of Sierra Nevada quality water
- This load responsibility offsets additional allocation provided to sub-areas that receive CVP water

# Estimated CVP Actual Loads

|                                                                          |                |                |                |                |                |

# Real-time Load allocations

- Base loads plus import water relaxation may still be too restrictive to allow for long-term compliance with water quality objectives since salt imports will continue to exceed salt exports
- The salt and boron TMDL includes opportunities to use real-time load allocations in lieu of base load allocations
- Real-time load allocations provides for additional load allocations

# Real-time Relaxation

- Real time relaxation may only be employed if physical and organizational infrastructure is put in place to effectively manage discharges in the basin
- An additional margin of safety will have to be used to assure compliance with water quality objectives

# Conclusions

- Framework for a salt and boron load allocation method has been presented
- Base load allocations evenly distributed throughout basin
- TMDL considers degraded supply water quality
- Responsibility for meeting salt load limits is shared by dischargers and the USBR

- Technical TMDL report is a staff work product and does not have any regulatory effect until the Regional Board adopts components of the TMDL into the Basin Plan...

# Next Steps (Regulatory)

- Complete Draft Basin Plan Amendment Staff Report:
  - Beneficial Uses
  - Water Quality Objectives
  - Program of Implementation
  - TMDL Elements (loading capacity, allocations, margin of safety)
  - Surveillance and Monitoring

# Basin Plan Amendment Timelines

- A draft basin plan amendment for the salt and boron TMDL will be developed by June 2002
- Regional Board consideration of the basin plan amendment is scheduled for June of 2003

# Basin Plan Amendment & Implementation Framework Considerations

- Concurrent Basin Planning and Implementation with OP Pesticide TMDL
- Concurrent Development of Dissolved Oxygen TMDL
- Development of additional salt and boron water quality objectives in SJR
- What is the future for current waiver of WDRs for irrigation return flows?

# Where You Can Be Most Effective

- Provide feedback on:
  - TMDL Report
  - Draft Program of Implementation
  - Participate in Draft Basin Plan Amendment Workshops
